#### Density in $C(\mathbb{R}^n)$

Density associated with the single hidden layer perceptron model

 $\Sigma(\sigma) = \operatorname{span}\{\sigma(w \cdot x - \theta) : \theta \in \mathbb{R}, w \in \mathbb{R}^n\}$ 

 $\sigma : \mathbb{R} \to \mathbb{R}$  activation function, weights  $w \in \mathbb{R}^n$ , bias  $\theta \in \mathbb{R}$ 

- Find conditions under which  $\Sigma(\sigma)$  is dense in C(K) for any compact set  $K \subset \mathbb{R}^n$
- Consider sigmoidal activation functions satisfying  $\lim_{x\to-\infty} \sigma(x) = 0$  and  $\lim_{x\to\infty} \sigma(x) = 1$
- Extend density to other function spaces ( $L^p$  spaces, the space of measurable functions  $\mathcal{M}$ )

• Density associated with the single hidden layer perceptron model

 $\Sigma(\sigma) = \operatorname{span}\{\sigma(w \cdot x - \theta) : \theta \in \mathbb{R}, w \in \mathbb{R}^n\}$ 

 $\sigma:\mathbb{R}\to\mathbb{R}$  activation function, weights  $w\in\mathbb{R}^n,$  bias  $\theta\in\mathbb{R}$ 

- Find conditions under which  $\Sigma(\sigma)$  is dense in C(K) for any compact set  $K \subset \mathbb{R}^n$
- Consider sigmoidal activation functions satisfying  $\lim_{x\to-\infty} \sigma(x) = 0$  and  $\lim_{x\to\infty} \sigma(x) = 1$
- Extend density to other function spaces ( $L^p$  spaces, the space of measurable functions  $\mathcal{M}$ )

• Consider perceptron model with at most r units in the hidden layer

$$\Sigma_r(\sigma) = \left\{ \sum_{i=1}^r a_i \sigma(w_i \cdot x - \theta_i) : a_i, \theta_i \in \mathbb{R}, w_i \in \mathbb{R}^n \right\}$$

#### Definition (Pinkus, 1999)

For function f in a normed linear space X define the order of approximation by

$$E(f; \Sigma_r(\sigma); X) = \inf_{g \in \Sigma_r(\sigma)} \|f - g\|_X.$$

Problem: target f is unknown!

Shpresim Sadiku

 $\blacksquare$  Consider perceptron model with at most r units in the hidden layer

$$\Sigma_r(\sigma) = \left\{ \sum_{i=1}^r \mathbf{a}_i \sigma(w_i \cdot x - \theta_i) : a_i, \theta_i \in \mathbb{R}, w_i \in \mathbb{R}^n \right\}$$

#### Definition (Pinkus, 1999)

- (Poggio et al., 2017) succeed in beating the curse of dimensionality by assuming the target function is *compositional*

# $\mathcal{G}-function$

ZIB

#### Definition (Poggio et al., 2017)

Let  $\mathcal{G}$  be a directed acyclic graph (DAG) with the set of nodes V. Define a  $\mathcal{G}$ -function  $f : \mathbb{R}^n \to \mathbb{R}$  with an architecture corresponding to  $\mathcal{G}$ , where each of the *n* source nodes of  $\mathcal{G}$  represents a one dimensional input of *f*. Inner nodes of  $\mathcal{G}$  represent constituent functions which get one real one-dimensional input from every incoming edge and the outgoing edges feed the one dimensional function value to the next node. There is only one sink node, whose output is the  $\mathcal{G}$ -function.

#### Definition (Poggio et al., 2017)

Define  $\mathcal{B}_p^{s,2}$  to be the class of compositional functions  $f : \mathbb{R}^n \to \mathbb{R}$ whose corresponding DAG  $\mathcal{G}$  has a binary tree architecture and constituent functions h are in  $\mathcal{B}_p^s(\mathbb{R}^2)$ .

## Breaking the Curse of Dimensionality with DNNs

### Theorem (Poggio et al., 2017)

Let  $f : \mathbb{R}^n \to \mathbb{R}$  be a compositional  $\mathcal{G}$ -function corresponding to a DAG  $\mathcal{G}$  with nodes V where each constituent function represented by node  $v \in V$  is in  $\mathcal{B}_{p^v}^{s_v}(\mathbb{R}^{n_v})$  for  $n_v$  the number of incoming edges of v. Then for  $\sigma \in C^{\infty}$ , the complexity of the shallow network to achieve accuracy at least  $\epsilon$  in the supremum norm is

$$\mathcal{O}\left(\epsilon^{-n/min_{v\in V}s_v}\right)$$

while the complexity of a deep network represented by  ${\mathcal G}$  in the supremum norm is

$$\mathcal{O}\left(\sum_{v\in V} \epsilon^{-n_v/s_v}\right).$$

### Breaking the Curse of Dimensionality with DNNs

### Theorem (Poggio et al., 2017)

Let  $f : \mathbb{R}^n \to \mathbb{R}$  be a compositional  $\mathcal{G}$ -function corresponding to a DAG  $\mathcal{G}$  with nodes V where each constituent function represented by node  $v \in V$  is in  $\mathcal{B}_{p}^{s_v}(\mathbb{R}^{n_v})$  for  $n_v$  the number of incoming edges of v. Then for  $\sigma \in C^{\infty}$ , the complexity of the shallow network to achieve accuracy at least  $\epsilon$  in the supremum norm is

$$\mathcal{O}\left(\epsilon^{-n/min_{v\in V}s_v}\right)$$

while the complexity of a deep network represented by  ${\mathcal G}$  in the supremum norm is

$$\mathcal{O}\left(\sum_{v\in V} \epsilon^{-n_v/s_v}\right).$$

### Breaking the Curse of Dimensionality (cont.)

- If the effective dimensionality of constituent functions is smaller than the effective dimensionality of the shallow network  $\frac{n}{\min_{v \in V} s_v}$ , then deep networks avoid the curse of dimensionality
- Extensions to the ReLU activation function (Bach, 2017)
- (Poggio et al., 2017) conjecture that compositional functions are common in nature and describe the structure of the brain (i.e., visual cortex)
